

5: Explore about Segue and create a short note on its use.

Ans:

A segue defines the transition between the two view controller in the storyboard file.

Segue is used to connect different view controls all together in order to understand the flow of the code.

6: Explore diff between Xib's And ViewController and create a short note on its difference

Ans:

Xib stands for XML interface builder. This is used to create the Graphical User Interface (GUI) for your applications with the help of Carbon and Cocoa. The files are saved in Xibs or Nibs format. Xib files are not in a package, but a self-contained XML file.

View Controller:

A view controller defines the GUI of various screens used in the application. Basically, the view controller is used to create the GUI without writing the complete code in the XIBs and can use the drag drop schema to develop the GUI of the application.
